[000169] quiroz gutierrez, dr. fernando tratado de anatomia humana vol 3.; mexico: editorial porrua, s.a., 1972. un libro que cuenta su tesina en la facultad de medicina de la universidad de guadalajara. ex-libris eam with regard to the angle of the excursion of the esophageal hiatus in the thorax, moore (1968) and bouchet & cuilleret (1973) related the angle of the diaphragm muscle fibers in the esophageal hiatus to the angle between the fibers and the mediastinal face. they proposed that if the angle were acute, then the diaphragm muscle fibers would be directed cranially, so the organ would move caudally. this movement would be absent if the angle was obtuse. some authors (bouchet & cuilleret; testut & latarjet; skandalakis et al.) proposed other variations in the angle of the muscles (skandalakis; bouchet & cuilleret) or the distance between the diaphragm muscle fibers (bouchet & cuilleret). but kishi & simpson (1969) did not observe differences in the angle of the fibers of the diaphragm in the esophageal hiatus according to the side. in this study, it was not possible to consider the variations of the angle of the diaphragm in the esophageal hiatus according to the side due to the presence of these muscles in other abdominal spaces, but the angle of the diaphragm fibers in the perineum was variable. some authors have reported that the angle of the fibers in the perineum was between 60° and 70° in women (sandstrom; bao et al.; bouchet & cuilleret) and 70° in men (ruggieri; moretti). it was also noted that differences in the angle measured at the perineum and in the anterior limit of the abdominal esophageal hiatus were more evident in the lateral than in the posterior side. moreover, the angle of the diaphragm in the esophageal hiatus was smaller in the left side than in the right side, even with the presence of collagen fiber bundles in both margins.

---

these differences between the left and right sides of the esophageal hiatus indicate that the presence of collagen fiber bundles determines more accurately the angle of the diaphragm fibers in this hiatus.

---

## Skandalakis Anatomia Y Tecnicas Quirurgicas Pdf 107

skandalakis et al. (1972) reported that both the esophageal hiatus and the tendinous center were anatomically comparable to a circle. the esophageal hiatus was formed by two circular, symmetric edges, and the tendinous center corresponded to the esophageal hiatus diameter. in this author's opinion, the esophageal hiatus corresponds to a circle. skandalakis et al. (1992) demonstrated that the relationship between the esophageal hiatus and the diaphragm muscle was highly variable and that the esophageal hiatus and the diaphragm muscle were not parallel to each other. the esophageal hiatus was located at the level of the diaphragm in most cases, and the distance between the tendinous center and the diaphragm margin was not constant. volume vii: respirazione e fonazione was not issued in the original. the material was included in volume viii. the original title of volume viii was teoria emancipativa, a title that was not included in the official catalogs of the instituto. this volume is a compendium of all the technical chapters of the first part of testut and latarjet's anatomia umana. it is published in the original italian and contains no translation. it is stamped by the institute of anatomy, budapest medical school. this book was issued by the hungary ministry of health. volume viii: respirazione e fonazione, 112 figures. [000380] surgical anatomy, vol i,ii,iii,iv; budapest: budapest medical school, 1913. hungarian. this book was issued by the hungary ministry of health. volume i: anatomia i, 478 figures. volume ii: anatomia ii, 258 figures. volume iii: anatomia iii, 89 figures. volume iv: anatomia iv, 83 figures. ex-libris eam 5ec8ef588b
